TITLE: Influence of resonator misalignment on the output power of a neon-helium laser

SOURCE: AN TurkSSR. Izvestiya. Seriya fiziko-tehnicheskikh, khimicheskikh, i geologicheskikh nauk, no. 4, 1966, 16-22

TOPIC TAGS: gas laser, laser R and D

SUB CODE: 20

ABSTRACT: An investigation of the extent to which disruption of ideal alignment of a laser resonator mirror system influences the properties, primarily the output power, of the oscillation. A neon-helium laser generating in the visible light at 6328A was investigated. The experimental setup consisted of a laser, a device for measuring small inclination angles of the mirror, a vacuum system and a power supply. The discharge tube of the laser was 4 millimeters in diameter and 88 centimeters long. The generator power as a function of inclination of one of the mirrors was investigated with various lengths of laser resonator. The least length was 133 centimeters. It was determined that the requirements for alignment of mirrors in a laser with spherical mirrors varies considerably. In the case of generation of many transverse types of oscillation, considerable (up to 3 minutes of arc) misalignment of the mirrors can be tolerated. In other cases, the maximum tolerable misalignment may be less than one minute. The limiting angle decreases with decreasing generator power and with

Abstract: per 1 g. of dry leaves. The amount of glycosides
in the leaves of annual plants grows during the
vegetation period, and reaches a maximum in Septem-
ber. It drops in November. In the leaves of bi-
ennial and perennial plants the quantity of glyco-
sides is greatest at the end of May and beginning
of June, during and after flowering this is reduced.
The glycoside content in the stem leaves of the bi-
ennial and perennial foxglove plants after flowering
do not meet the standards of the State pharmacopoeia
number eight. The biennial and perennial plants of
D. ambigua and D. lutea have a leaf glycoside con-
tent that corresponds to the requirements of the
State pharmacopoeia during the whole course of
vegetation, and the D. lanata exceeds the require-

 No. 179143

SOURCE: Izobreteniya, promyshlennyye obrastay, tovarnyye znaki, no. 4, 1966, 124

TOPIC TAGS: gas flow, aerodynamic drag

ABSTRACT: This Author's Certificate introduces a device containing braces for fastening an element inside a shell in a gas stream. Hydraulic drag is reduced and the reliability of the fastening is improved by installing the braces at an angle to the axis of the shell and by using ball-and-socket hinges for fastening the braces to the inside surface of the shell and to the element.

Title: Determination of the Amount of Hydrocarbons and Moisture Adsorbed by Activated Charcoal

Original
Publication: Gazovaya prom-st', 1956, No 6, 34-35

Abstract: Diagram of a laboratory unit and description of a method for the determination of the amount of hydrocarbons and moisture adsorbed by activated charcoal. Verification of the method by saturating a weighed sample of charcoal with a known amount of gasoline and propane, from hydrocarbon-air mixtures, and water, followed by their desorption, has shown that the differences between the amounts of hydrocarbons or water, expended to saturate the coal and their amounts recovered after desorption do not exceed 5%.

Title : Drying of a Gas in a Moving Layer of Adsorbent.

Orig Pub : Gaz. prom-st', 1956, No 11, 32-36

Abstract : Investigation of the method of drying air (A) in a moving layer of silica-gel (S) of different brands. The A saturated with moisture was passed through the layer of S, which was maintained in suspended state and flowed continuously from the adsorber to the desorber, where it was regenerated by heating at 200-240° with a concurrent blowing with A. It was found that even at a rate of $V = 1/4$ liter/cm² minute a drying of the gas to a moisture content corresponding to a dew point of - 50° can be achieved for prolonged periods. S of particle size of 0.2-0.5 mm

Card 1/3

begins to reach a fluidized state at $V = 0.75$ liter/cm² minute, but even at a rate twice as high and with a free space, above the layer, of not less than 40 cm in height, the entrainment of the S can be completely avoided. Suitable for drying are the finely porous varieties of S of brand ASM and MSM. The best results (to a dew point of - 80°) are obtained with Sokolovskiy bauxites, but their moisture holding capacity, at equilibrium, is 10 times less than of S, which results in a 6-10 fold heat expenditure for heating of the adsorbent during its regeneration. It was found that at low operational load, activated charcoal can also be used in a moving layer for the drying (to a dew point of - 60°). Charcoal of AR-3 brand, with a particle size of 0.5-1 mm, begins to reach a fluidized state at $V = 1.3$ liter/cm² minute. Analogous results were obtained on drying of natural gas (99% CH₄).

TITLE: A New Adsorbent for Acetylene

PERIODICAL: Zhurnal Vsesoyuznogo Khimicheskogo Obshchestva im. D.I.
Mendeleyeva, 1960, No. 6, Vol. 5, pp. 710-712

TEXT: The authors conducted an investigation of acetylene separation from the gaseous mixture formed in the production of acetylene by the partial oxidation of methane from natural gas (Ref. 1-Laslo). They used the following solid sorbents for the purpose in question: activated carbon, silica gel and synthetic zeolites (molecular filters). A special study was made of the adsorption ability, with respect to acetylene, of the 4A and 5A type zeolites, having a pore size of 4 and 5 Å, by comparing them to the action of activated carbon. The A type synthetic zeolites are given as being alkaline aluminosilicate $M_bO \cdot Al_2O_3 \cdot 2SiO_2 \cdot xH_2O$, where M is the cation, b- the valency of the cation, x- the number of H_2O molecules. The aluminosilicates, produced by precipitation in an aqueous solution, crystallize, and separate off from the mother liquor, are dried and calcined to remove the water. These granulated zeolites have pore sizes corresponding to the size of molecules of the

S/063/60/005/006/014/014
A051/A026

substances being adsorbed, and are, therefore, suitable as molecular filters (Ref. 2-Barrer). The adsorption ability with respect to acetylene of other molecular filters and adsorbents was investigated in a vacuum containing quartzite scales, of the MacBain type (Ref 3-Brunauer). The test was conducted at pressures of 700 mm m.c. and -78, -17, 20, 50 and 80°C, and tests on activated carbon and MCM silica gel - at the same pressures and temperatures, excepting the -78°C. The experimental data are shown in Figs. 1 (5A) and 2 (4A), pointing to the greater advantage of the synthetic zeolites with respect to acetylene adsorption. The table lists the relative activity of the molecular filters in g/100 g of adsorbent, in % to the activity of the SKT carbon, (Table 1). The test results led the authors to recommend the molecular filters for separating acetylene out from not only gases of the oxygen oxidation of methane, but also from gases of air conversion. The experimental data were also processed with equations of the potential theory, changed by M.M. Dubinin, in order to describe the process of gas absorption and that of vapors (Ref. 4-Nikolayev). For gas it is given as: $\epsilon = 2.3 RT \lg \tau^2 \frac{p_{kp}}{p}$ cal/mol (1), $W = a.b \text{ cm}^3/\text{g}$ (2). where ϵ is the adsorption potential, τ - corresponding

AO51/A026

temperature, ($\tau = \frac{T}{T_{Kp}}$), W - the volume of the space adsorbed, cm^3/g , a - the amount of acetylene adsorbed, $g/100g$ of the adsorbent, b - the volume of the m -mol of compressed vapor, cm^3/m -mol. For vapor it is given as:
 $\epsilon = 2.3 RT \lg \frac{P_s}{P}$ cal/mol (3), $W = a \cdot v^* cm^3/g$ (4), where v^* , is the volume of the m -mol of liquid in the adsorbed state, in cm^3/m -mol, P_s - the pressure of the saturated vapor at the experiment temperature. Fig. 3 shows the results of the processing performed. The curve enables one to determine the extent of absorption of the acetylene under the given conditions. There are 3 graphs and 1 table, 4 references: 2 are Soviet, 2 English.

TITLE: Investigation of the purification of hydrogen in a moving layer of activated coal
PERIODICAL: Referativnyy zhurnal. Khimiya, no. 5, 1962, 407, abstract 5K99 (Tr. Vses. n.-i. in-t prirodn. gazov, no. 12, 1961, 143 - 149)

TEXT: The process of adsorptional removal of impurities of CH_4 , CO, and N_2 from H_2 has been investigated; the initial gas passes up a vertical column in the opposite direction to a continuous layer of $\text{A}\Gamma\text{-2(AG-2)}$ and $\text{C}\text{A}\text{T(SKT)}$ activated coal. The height of the adsorption section was 70 cm. The coal was regenerated in the lower part of the column by heating in an electric tube furnace, with purified H_2 simultaneously blown through it. Experiments were made with $\text{H}_2\text{-CH}_4$ mixtures (up to 20% CH_4), and also with ternary (82% H_2 , 15% CO, and 3% CH_4) and quaternary (52.5% H_2 , 36.1% N_2 , Card 1/2

Investigation of the purification...

8.7% CO, and 2.7% CH₄) mixtures. It was found possible to obtain hydrogen of a purity of >99.9%. The best adsorbent is the highly active SKT coal, the specific surface area of which is ~1500 m²/g. The ideal conditions for the purification process are: pressure 25 atm, temperature during desorption 200°C, during adsorption the lowest possible, gas flow rate in the adsorption section 1 nl/cm², amount of pure H₂ used for blowing out impurities in the desorption section up to 10% of the total amount of purified gas produced. TITLE: Use of new absorbents for intensive gas drying

PERIODICAL: Khimicheskaya promyshlennost', no. 2, 1962, 24-29

TEXT: Experiments with granulated 4A (4A) and 5A (5A) zeolites for air- and gas drying were conducted. At 20°C and 10 mm Hg, the absorptive power of these zeolite types amounted to 20.8 and 20.6 g/100 g respectively. Investigation of the adsorption isotherms of water vapor at 0-35°C showed: (1) Superiority of the zeolites compared with silica gel and aluminum oxide, (a) owing to greater moisture capacity; (b) owing to lower temperature dependence. Gases may therefore be dried by zeolites without cooling the adsorber. Experiments with an adsorber tube of 1.3 mm diameter, granulation of the zeolites 1-2 mm, depth of layer 62 cm, were conducted with air of known dew point. Results: (1) A dew point of -60 to -65°C was reached for a rate of gas flow of 1.15 l/cm².min and 0.4 l/cm².min in the adsorption layer. (2) Temperature increase from 30 to 80°C reduces

Card 1/2

S/064/62/000/002/004/008
B101/B144

Use of new absorbents for ...

the dynamic activity of the zeolites from 21 g/100 g to 16 g/100 g. A rate of 3 l/cm².min is assumed to be permissible for industrial adsorbers. Experiments with natural gas from the Stavropol' deposit were also conducted at 50°C and 0.5 l/min. A dew point of -60°C was reached. Because of the selective H₂O vapor adsorption by zeolites the other gas components did not affect the adsorption. Even the heavy hydrocarbons do not penetrate the fine structure of the 4A zeolite pores, so that no coke formation sets in during regeneration. 200-350°C is the best regeneration temperature. For regeneration with cold gas, heating in direct flow is preferred: dew point for direct flow down to -80°C, for counter flow only -60 to -65°C. A mixture of 74.2% N₂, 5.7% CO, 6.5% H₂, 6.0% H₂O, and 7.6% CO₂ was also simultaneously dried and purified. H₂O was adsorbed most of all in the first zeolite layer and gradually displaced the CO₂ adsorbed in the following layers, which left the adsorber at a dew point below -45°C. At 12.8 g/cm³ moisture, the dynamic activity of the zeolite amounted to 10 g/100 g related to CO₂, and 11.3 g/100 g related to moisture. TITLE: Thorough drying of transformer oil by adsorption

PERIODICAL: Khimiya i tekhnologiya topliv i masel,
no.4, 1962, 21-24

TEXT: Transformer oil requires drying to obtain high electric strength, but existing methods of drying have various disadvantages. Accordingly, laboratory bench tests were made in which transformer oil was dried by passing over a column 200 mm long and 10 mm in diameter of NaA type artificial zeolites at rates of 0.002 and 0.005 m/sec which reduced the water content (measured by the Karl Fischer method) from about 600 to 24 - 30 parts per thousand [Abstractor's note: parts per million is surely intended] and raised the electric strength from 22 to 70 - 100 kV/cm. On the basis of these data the method is recommended for general use.

There are 5 figures and 2 tables.

Molecular sieves and their use (Molekulyarnyye sita i ikh primeneniye) Moscow,
Izd-vo "Khimiya", 1964. 0155p. illus., biblio. 2,300 copies printed.

TOPIC TAGS: petrochemistry, chemical separation, hydrocarbon, analytic chemistry,
molecular sieve, zeolite, crystal

PURPOSE AND COVERAGE: The book is a presentation both on the properties and
application of molecular sieves in purification and separation of gaseous and
liquid mixtures. The structures of natural and artificial zeolites used as
molecular sieves are described. Included are also methods for their practical
use in various branches of technology for drying, purification and separation of
hydrocarbons. Research results on membranes and films made from some materials
and used in capacity of molecular sieves are presented. The book is intended for
engineers and technicians in oil, gas and petrochemical industry.
